

1. What is the World Wide Web?

The World Wide Web is a global collection of public web pages, documents and media that you can access using the internet and a web browser

2. Explain the functional differences between a web application's front end and back end.

The frontend of the web application is the visible part that the users can see and interact with, while the backend is the hidden server-side system that handles data, logic and infrastructure

3. Describe what occurs on the back end during a web interaction using the Google query example or create your own example.

During a web interaction, the backend receives a request from your browser, processes business logic, talks to databases and sends back data or a response

4. What is the MERN stack?

The MERN stack is a collection of four JavaScript based technologies used together to build full-stack web applications

MERN stands for

- MongoDB: A NoSQL database that stores data in JSON like documents
- Express.js: a backend framework for Node.js that handles server routing and APIs
- React: a frontend library used to build interactive user interfaces with reusable components
- Node.js: a runtime environment that lets you run JavaScript on the server
